

# MACC Mobile for Accounting Master

Smartphones and tablets continue to boost productivity in the workplace. To capitalize on this evolving technology, our MACC Mobile for Accounting Master uses these devices to make the inventory and management processes for our clients easier and more efficient.

## Inventory made easy

MACC Mobile for Accounting Master allows employees to use smartphones and tablets they're already familiar with to undertake a wide variety of common inventory activities. The devices can be used to receive material into the inventory system, conduct item searches and sync-up physical counts with information stored in the database. Various inventory transactions can be performed including assignment to a customer account.

Instead of purchasing separate scanners to read bar codes on inventory that needs to be entered, employees can use Bluetooth scanners synced to their smartphones. These devices are less expensive than traditional bar code scanners and they allow employees to see the details captured from the barcode in an easy-to-read, web-optimized format.

## Make decisions on the go

MACC Mobile for Accounting Master allows management to make decisions on the go. Purchase requisitions, invoices, or payments can be reviewed and approved (or declined) using MACC Mobile. Detailed information, including associated attachments, can be viewed before making the approval decision. The power of the approval hierarchy is exemplified with the ability to access this information through various handheld devices.

## Key Benefits

- Use smartphones and tablet computers to assist in a wide variety of inventory related activities
- Reduced scanner expense through the use of Bluetooth devices
- Empower a greater number of employees to participate in the inventory process
- Approvals can be made on the go
